Target Role: Senior GenAI-SEO Engineer / AI Founding Engineer

1) AI/ML Repositories and Product Work

- **Stateful AI Travel Agent (LangGraph)**

Repository: <https://github.com/raunaqness/ai-travel-agent>

Live Demo: <https://ai-travel-agent.fly.dev/>

Highlights: graph-orchestrated multi-agent flow, memory-aware execution, tool-driven planning.

- **General GitHub Profile**

<https://github.com/raunaqness>

2) LLM, RAG, and Humanization-Relevant Work

Aptos India - LLM-Based Customer Support Chatbot (POC)

- Built an end-to-end LLM-powered chatbot using open-source models and managed cloud AI services.
- Integrated internal knowledge sources and analytics metadata with RAG and prompt optimization.
- Reduced incorrect answers by 35% and reduced dependency on manual support teams by 30%.
- Deployed via containerized MLOps workflows for repeatable experimentation and scalable inference.

Applied techniques:

- Prompt versioning and evaluation loops
- Retrieval design and context-selection strategies
- Response quality tuning (factuality, consistency, relevance)
- Runtime monitoring and iterative model behavior improvement

3) Backend and Platform Engineering at Scale

Aptos One (Unified Commerce Platform)

- Implemented backend control APIs for ML job lifecycle management on Kubernetes.
- Built distributed data pipelines with Python + BigQuery + GCP.
- Reduced batch runtime by 40%, improved data SLA by 35%, and reduced cloud cost by 60% (about USD 240K annually).

Additional backend systems:

- Turing: end-to-end ML deployment pipelines (Airflow, GCP, Docker), deployment time reduced by up to 60%.
- Clickpost: high-volume financial reconciliation system, cycle time reduced by 95% (about 2 days to minutes).

4) Stack Summary

Python, FastAPI, Django, SQL, Kafka, Redis, PostgreSQL, BigQuery, Docker, Kubernetes, Terraform, CI/CD, MLOps, LangChain, LangGraph, RAG, Vector DBs.

5) Notes for AISEO Use Cases

Experience is strongest in production LLM application engineering, RAG systems, prompt/evaluation frameworks, and scalable backend architecture. This background maps directly to GEO-oriented content systems, answer-quality optimization, and AI-powered SEO tooling.
