Hiring Team,

I am applying for the Senior Generative AI Engineer / AI Founding Engineer role at AISEO. I bring 8+ years of backend engineering experience and recent hands-on work shipping LLM-powered systems in production, including RAG pipelines, prompt evaluation workflows, and cloud-native AI infrastructure.

At Aptos India, I built enterprise AI systems for high-volume support workflows. I designed RAG pipelines with vector retrieval and context selection, implemented prompt versioning with quality evaluation, and reduced hallucinations by 35% through iterative testing and runtime monitoring. I also architected secure GCP data/model pipelines with IAM and audit controls, improving SLA performance by 35% and reducing compute spend by 60%.

On fine-tuning and model adaptation: my production work has primarily focused on prompt, retrieval, and evaluation optimization layers around foundation models, while applying model behavior tuning through controlled experimentation and domain-specific data curation. I am comfortable extending this into adapter-based workflows (for example LoRA/QLoRA) for SEO-specific tasks where measurable gains justify specialization.

A relevant technical challenge I solved was improving answer quality in enterprise knowledge-heavy workflows where factuality and usefulness were both critical. I addressed this by combining semantic retrieval tuning, prompt templates with strict grounding constraints, and offline/online evaluation loops. The result was better response quality with lower hallucination rates and stronger operational trust.

My GEO perspective is that search is shifting from link-ranking-first to answer-composition-first. Winning content must be machine-interpretable, entity-rich, and semantically aligned to intent across both traditional SERPs and AI answer engines. I would approach a humanization system by separating concerns: generation, authenticity scoring, SEO scoring, and policy checks, then optimizing each stage with measurable metrics (readability, factuality, topical coverage, and ranking performance) instead of a single black-box prompt.

I am available for full-time exclusive commitment and can align with Amsterdam working hours.

Portfolio links:
