SUMMARY

Senior AI Engineer with 8+ years of experience building Python-first production systems across backend platforms, machine learning infrastructure, and LLM-powered applications. Strong hands-on background in designing RAG pipelines, agentic workflows, and cloud-native AI services that solve complex business problems at scale. Experienced in taking AI products from architecture through deployment with a focus on reliability, observability, security, and measurable operational impact.

TECHNICAL SKILLS

AI Engineering: LLMs, RAG, LangChain, LangGraph, Prompt Engineering, Evaluation Workflows

Languages & Backend: Python, SQL, FastAPI, Django, PostgreSQL, Redis, Kafka

Cloud & Infra: GCP, AWS, Azure, Kubernetes, Docker, Terraform

Production ML: MLOps, CI/CD, MLflow, Model Monitoring, IAM, Audit Logging

Automation: n8n, API Integrations, Webhooks, Workflow Orchestration

EXPERIENCE

Network School

Resident

Feb 2026 – Present

Malaysia

- Building AI-native products at the intersection of machine learning systems and autonomous agent workflows.
- Driving end-to-end architecture across model selection, orchestration layers, infrastructure, and production deployment.
- Researching context engineering and solving memory-related problems in multi-agent workflows to improve long-running agent reliability and coordination.

Aptos India

Machine Learning Engineer

Jan 2023 – Feb 2026

Bangalore, India

Project: Aptos One – Enterprise unified commerce platform serving 100+ global retailers and processing billions of transactions annually.

- Architected Python-based ML platform services on Kubernetes for workload-aware scheduling, checkpoint-based recovery, and distributed job lifecycle management in SLA-bound production environments.
- Designed secure, fault-tolerant data and model pipelines on GCP, improving processing SLAs by 35% while supporting high-volume enterprise analytics workloads.
- Optimized cloud infrastructure and query execution patterns, reducing compute costs by 60% (about USD 240K annual savings) while improving scalability and observability.
- Technologies: Python, GCP, Vertex AI, BigQuery, Kubernetes, Docker, Terraform, Redis, CI/CD, IAM

Project: Generative AI & LLM Support Assistant

- Designed and implemented a production-oriented RAG architecture combining internal knowledge bases and structured analytics metadata to deliver context-aware answers for enterprise users.
- Built agentic workflows for retrieval, reasoning, and response generation using LangChain and LangGraph, improving semantic accuracy and reducing hallucinations by 35%.
- Deployed containerized inference services and evaluation workflows to support secure experimentation, scalable rollout, and traceable model behavior in enterprise environments.
- Technologies: Python, LangChain, LangGraph, Vertex AI, Vector DB, FastAPI, Docker, MLOps

Turing.com

Senior Software Engineer

Apr 2022 – Dec 2022

India (Remote)

Project: End-to-End ML Deployment Platform

- Designed and implemented production ML pipelines in Python for ingestion, training, validation, and automated deployment using Airflow.

- Standardized CI/CD, model versioning, and deployment practices, reducing release time by 60% and improving reliability of production rollouts.
- Built monitoring and validation checks that increased maintainability and operational confidence for deployed ML systems.
- Technologies: Python, Django, Airflow, GCP, Docker, MLOps

Clickpost Pvt. Ltd.

Apr 2021 – Apr 2022

*Senior Software Engineer**Bangalore, India***Project: Cash Reconciliation Automation Platform** – serving 1,000+ enterprise customers handling high-volume CoD transactions.

- Designed and built a Python-based financial reconciliation platform processing large-scale transaction datasets with strict accuracy, traceability, and availability requirements.
- Reduced reconciliation cycle time by 95% (from about 2 days to minutes) through parallelized processing and automated validation workflows.
- Architected scalable backend APIs and ingestion pipelines under high-availability constraints, improving operational efficiency and financial visibility.
- Technologies: Python, Django, PostgreSQL, AWS, Redshift, Kafka, Docker, Kubernetes

Veda Labs Pvt. Ltd.

Jul 2018 – Apr 2021

*Software Engineer**New Delhi, India***Project: Video Analytics Platform** – Computer vision platform deployed on-premise for retail analytics using CCTV footage.

- Developed containerized Python pipelines for video analytics on edge devices in production retail environments.
- Built Kafka-based streaming services for scalable real-time processing of computer vision workloads.
- Technologies: Python, OpenCV, Computer Vision, Kafka, Docker

PROJECTS

Stateful AI Travel Agent (LangGraph)

- Engineered a memory-aware multi-agent application for dynamic travel planning with graph-based orchestration and tool-driven reasoning.
- Github: <https://github.com/raunaqness/ai-travel-agent>
- Demo: <https://ai-travel-agent.fly.dev/>

Workflow Automation Platform (n8n + Azure)

- Designed and deployed AI-assisted workflow automation integrating APIs and LLM services for secure, scalable business process execution.

EDUCATION

Indraprastha University

Aug 2014 – Jun 2018

*Bachelor of Technology – Computer Science Engineering**New Delhi, India*
